### ABSTRACT

We analyze the effect of magnetic field on convective heat and mass transfer flow of a viscous electrically-conducting fluid through a porous medium in a rectangular duct with Soret, Dufour, chemical reaction, and thermal radiation effects. The equations governing the flow, heat and mass transfer are solved by employing the Galerkin Finite element analysis with tri-nodal triangular elements. The temperature and concentration distributions are analyzed for different values of  $M$ ,  $Q$ ,  $Rad$ ,  $S_0$ ,  $Du$  and  $\gamma$ . The rates of heat and mass transfer are evaluated numerically for different parametric values. The numerical results obtained in the present paper are validated by favorable comparison with previous published results.

**Keywords:** Heat and Mass transfer; Rectangular duct; Hartmann number; Soret and Dufour effect; Thermal radiation; Radiation absorption; Non-linear density-temperature relation.

### Nomenclature

a, b, c	non-dimensional variable	Tc	temperature at the cold wall
C	concentration	Th	temperature at the warm wall
Cc	concentration on cold wall	u, v	velocity components
Ch	concentration on warm wall	u', v'	Darcy velocities
Cp	specific heat at constant pressure	x	horizontal coordinate
D <sup>-1</sup>	inverse Darcy parameter	y	vertical coordinate
Du, Daf	Dufour parameter		
G	Grashof number		
g'	acceleration due to gravity		<i>Greek symbols</i>
H <sub>0</sub> , $\overline{H}$	strength of the magnetic field	$\alpha$	heat source parameter
k	permeability of the porous medium	$\beta_0, \beta_1$	thermal expansion coefficients
K	chemical reaction parameter	$\beta^*$	volume coefficient of expansion with mass fraction concentration
kf	thermal conductivity	$\phi$	dimensionless heat generation or absorption
K <sub>11</sub>	cross diffusivity	$\mu$	coefficient of viscosity
M	Hartmann number	$\mu_e$	magnetic permeability
N	buoyancy ratio	$\nu$	kinematic viscosity
N <sub>1</sub> (Rad)	thermal radiation parameter	$\theta$	dimensionless temperature
Nu	Nusselt number	$\rho$	density of fluid
Pr	Prandtl number	$\sigma$	electrical conductivity
p'	pressure	$\Omega$	verticity
Q	radiation absorption	$\Psi$	dimensionless stream function
qr	radiative heat flux	$\phi$	stream function
Ra	Rayleigh number	$\gamma$	non-linear density temperature relation
So	Soret parameter	$\Gamma$	condensate mass flow rate
Sc	Schmidt number		<i>Subscripts</i>
Sh	Sherwood number	c	cold wall
T'	temperature	h	warm side wall

### INTRODUCTION

Advanced studies in the convective heat and mass transfer in porous medium provided greater industrial standing and generated research interest in many academicians and scientists. Equally, natural convection, the genesis of

which is due to the effect of density difference in a body force fluid resulted from a difference in temperature or concentration parameters, plays a key role in wider industrial applications. Natural convection adversely affects local growth conditions and enhances the overall transport rate. The combination of temperature and concentration gradients in the fluid will lead to buoyancy-driven flows. This has an important influence on the solidification process in a binary system. When heat and mass transfer occurs simultaneously, it leads to a complex fluid motion called double-diffusive convection.

Studies related to double-diffusive MHD boundary layer flow with heat and mass transfer over flat surfaces are extremely important and have many applications in engineering and industrial processes. For instance, heat and mass transfer occur in processes, such as drying, evaporation at the surface of a water body, and energy transfer in a wet cooling tower, cooling of nuclear reactors, MHD power generators, MHD pump, chemical vapor deposition on surfaces, formation and dispersion of fog, and distribution of temperature and moisture over agriculture fields. Double-diffusion occurs in a wide range of scientific fields such as oceanography, astrophysics, geology, biology and chemical processes. Extensive study was made by Ostrach *et al.* [1] and Viskanta *et al.* [2] on this given subject. A fundamental study of scale analysis relative to heat and mass transfer within cavities submitted to horizontal combined and pure temperature and concentration gradients was analysed by Bejan [3]. An experimental study has been done by Kamotani *et al.* [4] considering natural convection in shallow enclosures with horizontal temperature and concentration gradients. Similar experimental studies on thermo-solutal convection in rectangular enclosures were reported by Lee and Hyun [5] and Lee *et al.* [6] in unsteady double-diffusive convection in a rectangular enclosure with aiding and opposing temperature and concentration gradients. Ranganathan and Viskanta [7], Trevisan and Bejan [8], Beghein *et al.* [9] and Nishimura *et al.* [10] and others extended the related numerical studies dealing with double-diffusive natural convection in cavities. Sivaiah [11] investigated double-diffusive convective heat transfer flow of a viscous fluid through a porous medium with rectangular duct with thermo-diffusion by using the finite-element technique. Chamkha and Al-Naser [12] have investigated the hydromagnetic double-diffusive convection in a rectangular enclosure with opposing temperature and concentration gradients. Shanthi *et al.* [13] have investigated double-diffusive flow in a rectangular cavity using Darcy model. They have analyzed the effect of dissipation radiation on the double-diffusive flow of a viscous fluid in the rectangular cavity. Farhany and Tarun [14] numerically studied the double-diffusive natural convective heat and mass transfer in an inclined rectangular cavity filled with porous medium.

Several applications were witnessed in the industry of fluids that are electrically conducting induced by magnetic field. Oreper and Szekely [15] studied the effect of an externally imposed magnetic field on buoyancy driven flow in a rectangular cavity and found that the presence of a magnetic field can suppress natural convection currents. Magnetic and gravitational natural convection of melted silicon-two dimensional numerical computations for the rate of heat transfer was studied by Ozoe and Maruo [16]. Natural convection heat transfer in rectangular enclosures with traverse magnetic field were studied by Garandet *et al.* [17] and Alchaar *et al.* [18]. The effects of magnetic field on free convection in a rectangular enclosure was studied by Rudraiah *et al.* [19]. Numerical study of laminar natural convection in tilted enclosure with transverse magnetic field was investigated by Al-Najem *et al.* [20]. Yu *et al.* [21] numerically investigated the natural convection in a rectangular cavity under different directions of uniform magnetic field.

The study of natural convection heat transfer induced by internal heat generation has assumed much importance over time due to several applications in geophysics and energy-related engineering problems. Such applications include heat removal from nuclear fuel debris, underground disposal of radioactive waste materials, storage of foodstuff, and exothermic chemical reactions in packed-bed reactor. In a numerical study of two-dimensional natural convection of air in an externally heated vertical or inclined square box containing uniformly distributed internal energy sources conducted by Acharya and Goldstein [22], it was found that the average heat flux ratio along the cold wall increased with increasing external Rayleigh numbers and decreasing internal Rayleigh numbers. Their studies also revealed two distinct flow pattern systems depending on the ratio of the internal to the external Rayleigh numbers. Churbanov *et al.* [23] investigated unsteady natural convection of a heat generating fluid in a vertical rectangular enclosure with isothermal or adiabatic rigid walls. Similar related works dealing with temperature-dependent heat generation effects were studied by Vajravelu and Nayfeh [24] and Chamkha [25]. A numerical investigation of the steady MHD free convection in a rectangular cavity filled with a fluid-saturated porous medium and with internal heat generation was studied by Grosan *et al.* [26]. Reddy and Narasimhan [27] investigated heat generation effects in natural convection inside a porous annulus. The effect of magnetic field on mixed convection heat transfer in a lid-driven square cavity was studied by Baker *et al.* [28].

Viscous dissipation, a partially irreversible process, which happens due to shear forces transforming heat into fluid flow, has been studied by many researchers for different geometries. Verschoor *et al.* [29] have studied the effect of viscous dissipation and radiation on unsteady MHD free convection flow past vertical plate in porous medium. They

found that the temperature profile increases when viscous dissipation increases. Barletta and Pulvirenti [30] studied the forced convection with slug flow and viscous dissipation in a rectangular duct. Van Rij *et al.* [31] investigated the effect of viscous dissipation and rarefaction on rectangular micro channel convective heat transfer. Padmavathi [32] Nagaradhika [33] and Sreenivasa [34] have analyzed the connective heat transfer through a porous medium in a rectangular cavity with heat sources and dissipation under varied conditions. Umavathi and Odelu [35] studied the effect of variable viscosity on free convection in a vertical rectangular duct. Umavathi and Sheremet [36] further studied the viscous dissipation and the influence of temperature dependent conductivity of a nanofluid in a vertical rectangular duct.

Thermal radiation plays a significant role in many engineering applications particularly when the temperature is high. In the case of free convection or when the effects of variable properties are also included, the energy transformation can be a function of difference between  $T_1$  and  $T_0$ . Radiation contributes significantly to the transfer of energy in furnaces, chambers of combustion, rocket plumes, heat exchangers under high temperatures, nuclear reactors and the like. On the other hand, in case of conduction and convection are suppressed, thermal radiation plays an important role during heat transfers even at temperatures of lower degrees like in thermos bottles and space craft thermal control. Makinde [37] studied free convection flow with thermal radiation and mass transfer past a moving vertical plate. Chiu *et al.* [38] studied the mixed convection heat transfer in horizontal rectangular ducts with radiation effects. Sakurai *et al.* [39] studied the radiation effects on mixed turbulent natural and forced convection in a horizontal channel using direct numerical simulation and found that the radiation effect changes the distributions of the temperature fluctuation intensity and the turbulent heat flux. Mahapatra *et al.* [40] studied the mixed convection flow in an inclined enclosure under magnetic field with thermal radiation and heat generation. Recently, Lee *et al.* [41] investigated the characteristics of premature and stable critical heat flux for downward flow boiling at low pressure in a narrow rectangular channel. Liu *et al.* [42] reviewed the near-field thermal radiation and brought out the recent applications in the subject. Sheikholeslami *et al.* [43] numerically studied the MHD free convection of  $Al_2O_3$ -water nanofluid considering thermal radiation.

Heat transfer occurs through insulation materials by conduction, while heat loss to or gaining of heat from atmosphere occur by means of convection and radiation. Materials, which have low thermal conductivity, are those, which have a high proportion of small voids containing air. These voids are not big enough to transmit heat by convection or radiation and therefore the rate of heat transfer reduces. The mass flux created by a temperature gradient and the energy flux resulted by concentration differences is known as thermal-diffusion (Soret) effect and diffusion-thermo (Dufour) effect respectively. The importance of the Soret and Dufour effects are visible in many practical applications preferably in areas such as geosciences chemical engineering etc., Cheng [44] investigated the Soret and Dufour effects on natural convection boundary layer flow over a vertical cone in a porous medium with constant wall heat and mass fluxes. Chamkha *et al.* [45] studied the hydromagnetic double-diffusive convection in a rectangular enclosure with linearly heated and concentrated wall(s) in the presence of heat generation/absorption effects. Motozawa *et al.* [46] experimentally investigated on the heat transfer characteristics in rectangular duct flow of a magnetic fluid under magnetic field. Umavathi and Chamkha [47] studied natural convection flow in a vertical rectangular duct with isothermal wall boundary conditions. Chamkha *et al.* [48] studied heat and mass transfer in a porous medium filled rectangular duct with Soret and Dufour effects under inclined magnetic field. Zhang and Huang [49] studied the effect of magnetic obstacle on fluid flow and heat transfer in a rectangular duct. Stelian [50] studied the MHD effects in turbulent duct flows under the influence of transverse uniform and non-uniform magnetic fields. Recently, Srinivasacharya and Himabindu [51] studied effect of magnetic field on entropy generation due to micropolar fluid flow in a rectangular duct. Kishan and Sekhar [52] applied the Finite element analysis to study the fully developed unsteady MHD convection flow in a vertical rectangular duct with viscous dissipation and heat source/sink. Wang [53] brought out analytic solutions for pulsatile flow through annular, rectangular and sector ducts filled with a Darcy–Brinkman medium.

In this paper, we investigate the effect of magnetic field on convective heat and mass transfer flow of a viscous electrically-conducting fluid through a porous medium in a rectangular cavity with thermal radiation and dissipative effects. To determine the surface porosity, a closely packed porous material with respect to the structure of the pore space of the porous medium is considered. The duct is filled with saturated porous medium, and the flow of the working fluid was analyzed using a Darcy model which takes into account buoyancy and all the remaining effects of the rectangular duct. The equations governing the flow, heat and mass transfer are solved by employing the Galerkin Finite element analysis with tri-nodal triangular elements. The temperature and concentration distributions are analyzed for different values of  $M$ ,  $Q$ ,  $Rad$ ,  $So$ ,  $Du$  and  $\gamma$ . The rates of heat and mass transfer are evaluated numerically for different parametric values.

### 1. Problem Formulation

We consider the mixed convective heat and mass transfer flow of a viscous incompressible fluid in a saturated porous medium confined in the rectangular duct as shown in Fig. 1 whose base length is  $a$  and height  $b$ . The heat flux on the base and top walls is maintained constant. The Cartesian coordinate system  $O(x,y)$  is chosen with origin on the central axis of the duct and its base parallel to  $x$ -axis.

We assume that

- The convective fluid and the porous medium are everywhere in local thermal equilibrium with the solid matrix .
- There is no phase change of the fluid in the medium.
- The properties of the fluid and of the porous medium are homogeneous and isotropic (uniform with a constant porosity and permeability)
- The porous medium is assumed to be closely packed so that Darcy's momentum law is adequate in the porous medium.
- The effect of buoyancy force is acting on the fluid. So, well known Boussinesq approximation is applicable.
- The magnetic Reynolds number is assumed to be small so that the induced magnetic field can be neglected compared to the applied magnetic field.

Fig. 1 Schematic Diagram of the Problem

In this problem we follow Darcy model (as fluid flow is through a porous medium), in momentum equation and considering Boussinesq approximation with magnetic field  $\overline{H}$ . Under these assumption the momentum equations in the  $x$  and  $y$  directions are as follows (Revnicek et al. [54])

$$0 = -\left(\frac{\mu}{k}\right)u' - \frac{\partial p}{\partial x'} - \frac{\sigma\mu_e^2 H_0^2}{\rho'}$$

$$0 = -\left(\frac{\mu}{k}\right)v' - \frac{\partial p}{\partial y'} - \frac{\sigma\mu_e^2 H_0^2}{\rho'}(v'_1) - \rho'\overline{g}$$

Eliminating the pressure  $p$  by cross differentiation of above two equations, we get

$$0 = -\left(\frac{\mu}{k}\right)\left(\frac{\partial u'}{\partial y'} - \frac{\partial v'}{\partial x'}\right) + \frac{\sigma\mu_e^2 H_0^2}{\rho'}\left(-\frac{\partial u'}{\partial y'} + 2\frac{\partial v'}{\partial y'} + \frac{\partial v'^2}{\partial x'}\right) + \frac{\partial}{\partial x'}(\rho'\overline{g})$$

Under these assumptions, the governing equations of the present work are based on the balanced laws of mass, momentum energy and concentration in two dimensions. Following the assumptions of the magnetic field used by Chamkha and Al-Naser [12], the governing equations can be written in the form of dimensional equations as

$$\frac{\partial u'}{\partial x'} + \frac{\partial v'}{\partial y'} = 0 \quad (1)$$

$$u' = -\frac{k}{\mu}\left(\frac{\partial p'}{\partial x'}\right) \quad (2)$$

$$v' = -\frac{k}{\mu}\left(\frac{\partial p'}{\partial y'} + \rho'g\right) - \left(\frac{\sigma\mu_e^2 H_0^2}{\mu/\rho}\right)v \quad (3)$$

$$\rho\sigma c_p\left(u'\frac{\partial T'}{\partial x'} + v'\frac{\partial T'}{\partial y'}\right) = k_f\left(\frac{\partial^2 T'}{\partial x'^2} + \frac{\partial^2 T'}{\partial y'^2}\right) + Q(T_0 - T) - \frac{\partial(q_r)}{\partial x} + \frac{D_m K_T}{C_s C_p}\left(\frac{\partial^2 C}{\partial x'^2} + \frac{\partial^2 C}{\partial y'^2}\right) \quad (4)$$

$$\left( u' \frac{\partial C}{\partial x'} + v' \frac{\partial C}{\partial y'} \right) = D_1 \left( \frac{\partial^2 C}{\partial x'^2} + \frac{\partial^2 C}{\partial y'^2} \right) + \frac{D_m K_T}{K_m} \left( \frac{\partial^2 T}{\partial x'^2} + \frac{\partial^2 T}{\partial y'^2} \right) - k' C \tag{5}$$

$$\rho' = \rho_0 \left\{ \begin{array}{l} 1 - \beta_0 (T' - T_0) - \beta_1 (T' - T_0)^2 \\ - \beta^* (C' - C_0) \end{array} \right\}$$

$$T_0 = \frac{T_h + T_c}{2}, C_0 = \frac{C_h + C_c}{2} \tag{6}$$

where  $u'$  and  $v'$  are Darcy velocities along  $\theta$  - (x, y) direction.  $T'$ ,  $C$ ,  $p'$  and  $g'$  are the temperature, concentration, pressure and acceleration due to gravity,  $T_c$ ,  $C_c$  and  $T_h$ ,  $C_h$  are the temperature and concentration on the cold and warm side walls, respectively.  $\rho'$ ,  $\mu$ ,  $\nu$ ,  $\beta_0$  and  $\beta_1$ , are the density, coefficients of viscosity, kinematic viscosity and thermal expansions of the fluid,  $k$  is the permeability of the porous medium,  $k_f$  is the thermal conductivity,  $C_p$  is the specific heat at constant pressure,  $Q$  is the strength of the heat source,  $k_{11}$  is the cross diffusivity,  $\beta^*$  is the volume coefficient of expansion with mass fraction concentration and  $q_r$  is the radiative heat flux.  $\sigma$  is the electrical conductivity,  $\mu_e$  is the magnetic permeability of the medium and  $H_0$  is the strength of the magnetic field. This means that solutions to the ideal MHD equations are only applicable for a limited time for a region of a given size before diffusion becomes too important to ignore.

The boundary conditions for the problem are

$$\begin{array}{ll} u' = v' = 0 & \text{on the boundary of the duct;} \\ T' = T_c, C=C_c & \text{on the side wall to the left;} \\ T' = T_h, C=C_h & \text{on the side wall to the right;} \\ \frac{\partial T'}{\partial y} = 0, \frac{\partial C'}{\partial y} = 0 & \text{on the top } y = 0 \text{ and} \end{array} \tag{7}$$

Bottom  $u = v = 0$  walls  $y = 0$  which are insulated.

Invoking the Rosseland approximation for radiation

$$q_r = \frac{4\sigma^*}{3\beta_R} \frac{\partial T'^4}{\partial y}$$

Expanding  $T^4$  in Taylor's series about  $T_e$  and neglecting higher-order terms  $T'^4 \cong 4T_e^3 T' - 3T_e^4$

We now introduce the following non-dimensional variables

$$\begin{array}{lll} x' = ax; & y' = by; & c = b/a \\ u' = (v/a)u; & v' = (v/a)v; & p' = (v^2 \rho/a^2)p \\ T' = T_0 + \theta (T_h - T_c) & C' = C_0 + \phi (T_h - T_c) \end{array} \tag{8}$$

The governing equations in the non-dimensional form are

$$u = - \left( \frac{K}{a^2} \right) \frac{\partial p}{\partial x} \tag{9}$$

$$v = - \frac{k}{a^2} \frac{\partial p}{\partial y} - \frac{kag}{\nu^2} + \frac{kag(\beta_0(T_h - T_c)\theta + \beta_1(T_h - T_c)^2 \theta^2)}{\nu^2} + \frac{kag\beta^*(C_h - C_c)\phi}{\nu^2} - \left( \frac{\sigma\mu_e^2 H_0^2}{\mu/\rho} \right) v \tag{10}$$

$$P_r \left( u \frac{\partial \theta}{\partial x} + v \frac{\partial \theta}{\partial y} \right) = \left( 1 + \frac{4N_1}{3} \right) \left( \frac{\partial^2 \theta}{\partial x^2} + \frac{\partial^2 \theta}{\partial y^2} \right) - \alpha \theta + Du \left( \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} \right) \tag{11}$$

$$Sc \left( u \frac{\partial \phi}{\partial x} + v \frac{\partial \phi}{\partial y} \right) = \left( \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} \right) - k\phi + ScSo \left( \frac{\partial^2 \theta}{\partial x^2} + \frac{\partial^2 \theta}{\partial y^2} \right) \tag{12}$$

In view of the equation of continuity, we introduce the stream function  $\psi$  as

$$u = \frac{\partial \psi}{\partial y} ; \quad v = -\frac{\partial \psi}{\partial x} \quad (13)$$

Eliminating p from the Eqs. (9) and (10) and making use of Eq. (11) the equations in terms of  $\psi$  and  $\theta$  are

$$((1 + M^2) \frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2}) = -Ra \left( \frac{\partial \theta}{\partial x} (1 + 2\gamma\theta) + N \frac{\partial \phi}{\partial x} \right) \quad (14)$$

$$Pr \left( \frac{\partial \psi}{\partial y} \frac{\partial \theta}{\partial x} - \frac{\partial \psi}{\partial x} \frac{\partial \theta}{\partial y} \right) = \left( 1 + \frac{4}{3N_1} \right) \left( \frac{\partial^2 \theta}{\partial x^2} + \frac{\partial^2 \theta}{\partial y^2} \right) - \alpha\theta + Du \left( \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} \right) \quad (15)$$

$$Sc \left( \frac{\partial \psi}{\partial y} \frac{\partial \phi}{\partial x} - \frac{\partial \psi}{\partial x} \frac{\partial \phi}{\partial y} \right) = \left( \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} \right) - k\phi + ScSo \left( \frac{\partial^2 \theta}{\partial x^2} + \frac{\partial^2 \theta}{\partial y^2} \right) \quad (16)$$

where

$$G = \frac{g\beta(T_h - T_c)a^3}{\nu^2}, \quad D^{-1} = \frac{K}{a^2}, \quad Pr = \mu c_p / k_f, \quad \alpha = Qa^2/k_f, \quad Ra = G * D^{-1} = \frac{\beta g(T_h - T_c)Ka}{\nu^2}, \quad N_1 = \frac{3\beta_R K_1}{4\sigma^* T_e^3},$$

$$Sc = \frac{\nu}{D_1}, \quad k = \frac{k'a^2}{D_1}, \quad So = \frac{D_m K_T (T_h - T_c)}{\nu K_m (C_h - C_c)}, \quad Du = \frac{D_m K_t (C_h - C_c)}{C_s C_p (T_h - T_c)}, \quad N = \frac{\beta^* (C_h - C_c)}{\beta(T_h - T_c)}, \quad M^2 = \frac{\sigma \mu_e^2 H_o^2 a^2}{\nu}$$

are the Grashof number, Porosity parameter, Prandtl number (Pr=0.71), heat source parameter, Rayleigh number, radiation parameter, Schmidt number, chemical reaction parameter, Soret parameter, Dufour parameter, buoyancy ratio, and the Hartmann number, respectively.

The four dimensionless boundary conditions are

$$\frac{\partial \psi}{\partial x} = 0, \frac{\partial \psi}{\partial y} = 0 \text{ on } x=0, \theta=1, \phi=1 \quad \text{and} \quad (17) \quad \frac{\partial \psi}{\partial x} = 0, \frac{\partial \psi}{\partial y} = 0 \text{ on } x=1, \theta=0, \phi=0 \quad (18)$$

## 2. Finite-Element Analysis and Problem Solution

The region is divided into a finite number of tri-nodal triangular elements, in each of which the element equation is derived using the Galerkin weighted residual method. In each element  $f_i$ , the approximate solution for an unknown  $f$  in the variational formulation is expressed as a linear combination of shape function  $(N_k^i)_{k=1,2,3}$ , which are linear polynomials in  $x$  and  $y$ . This approximate solution of the unknown  $f$  coincides with actual values at each node of the element. The variational formulation results in a  $3 \times 3$  matrix equation (stiffness matrix) for the unknown local nodal values of the given element. These stiffness matrices are assembled in terms of global nodal values using inter-element continuity and boundary conditions resulting in a global matrix equation.

In each case, there are  $r$  distinct global nodes in the finite-element domain and  $f_p$  ( $p = 1, 2, \dots, r$ ) is the global nodal values of any unknown  $f$  defined over the domain then

$$f = \sum_{i=1}^8 \sum_{p=1}^r f_p \Phi_p^i$$

where the first summation denotes summation over  $s$  elements and the second one represents summation over the independent global nodes and  $\Phi_p^i = N_k^i$ , if  $p$  is one of the local nodes say  $k$  of the element  $e_i = 0$ , otherwise  $f_p$ 's are determined from the global matrix equation. Based on these lines, we now make a finite-element analysis of the given problem governed by Eqs. (14) through (16) subjected to the conditions Eqs. (17) and (18).

Let  $\psi^i$ ,  $\theta^i$  and  $\phi^i$  be the approximate values of  $\psi$ ,  $\theta$  and  $\phi$  in an element  $\theta_i$

$$\psi^i = N_1^i \psi_1^i + N_2^i \psi_2^i + N_3^i \psi_3^i \quad (19)$$

$$\theta^i = N_1^i \theta_1^i + N_2^i \theta_2^i + N_3^i \theta_3^i \quad (20)$$

$$\phi = N_1^i \phi_1^i + N_2^i \phi_2^i + N_3^i \phi_3^i \quad (21)$$

Substituting the approximate value  $\psi^i, \theta^i$  and  $\phi^i$  for  $\psi, \theta$  and  $\phi$  respectively in Eq. (13), the error

$$E_1^i = \left(1 + \frac{4}{3N_1}\right) \frac{\partial^2 \theta^i}{\partial x^2} + \frac{\partial^2 \theta^i}{\partial y^2} - \text{Pr} \left( \frac{\partial \psi^i}{\partial y} \frac{\partial \theta^i}{\partial x} - \frac{\partial \psi^i}{\partial x} \frac{\partial \theta^i}{\partial y} \right) - \alpha \theta + Du \left( \frac{\partial^2 \phi^i}{\partial x^2} + \frac{\partial^2 \phi^i}{\partial y^2} \right) \tag{22}$$

$$E_2^i = \frac{\partial^2 \phi^i}{\partial x^2} + \frac{\partial^2 \phi^i}{\partial y^2} - Sc \left( \frac{\partial \psi^i}{\partial y} \frac{\partial \phi^i}{\partial x} - \frac{\partial \psi^i}{\partial x} \frac{\partial \phi^i}{\partial y} \right) - k \phi^i + ScSo \left( \frac{\partial^2 \phi^i}{\partial x^2} + \frac{\partial^2 \phi^i}{\partial y^2} \right) \tag{23}$$

Under the Galerkin method, this error is made orthogonal over the domain of  $e_i$  to the respective shape functions (weight functions) where

$$\int_{e_i} E_1^i N_k^i d\Omega = 0, \quad \int_{e_i} E_2^i N_k^i d\Omega = 0$$

$$\int_{e_i} N_k^i \left( \left(1 + \frac{4}{3N_1}\right) \left( \frac{\partial^z \theta^i}{\partial x^2} + \frac{\partial^z \theta^i}{\partial y^2} \right) - \text{Pr} \left( \frac{\partial \psi^i}{\partial y} \frac{\partial \theta^i}{\partial x} - \frac{\partial \psi^i}{\partial x} \frac{\partial \theta^i}{\partial y} \right) - \alpha \theta + Du \left( \frac{\partial^z \phi^i}{\partial x^2} + \frac{\partial^z \phi^i}{\partial y^2} \right) \right) d\Omega = 0 \tag{24}$$

$$\int_{e_i} N_k^i \left( \left( \frac{\partial^z \phi^i}{\partial x^2} + \frac{\partial^z \phi^i}{\partial y^2} \right) - Sc \left( \frac{\partial \psi^i}{\partial y} \frac{\partial \phi^i}{\partial x} - \frac{\partial \psi^i}{\partial x} \frac{\partial \phi^i}{\partial y} \right) - k \phi^i + ScSo \left( \frac{\partial^z \theta^i}{\partial x^2} + \frac{\partial^z \theta^i}{\partial y^2} \right) \right) d\Omega = 0 \tag{25}$$

Using Green's theorem, we reduce the surface integral of Eqs. (24) and (25) without affecting the  $\psi$  terms and obtain

$$\int_{e_i} N_k^i \left\{ \left(1 + \frac{4}{3N_1}\right) \frac{\partial N_k^i}{\partial x} \frac{\partial \theta^i}{\partial x} + \frac{\partial N_k^i}{\partial y} \frac{\partial \theta^i}{\partial y} - \text{Pr} N_k^i \left( \frac{\partial \psi^i}{\partial y} \frac{\partial \theta^i}{\partial x} - \frac{\partial \psi^i}{\partial x} \frac{\partial \theta^i}{\partial y} \right) - \alpha \theta + Du \left( \frac{\partial N_k^i}{\partial x} \frac{\partial \phi^i}{\partial x} + \frac{\partial N_k^i}{\partial y} \frac{\partial \phi^i}{\partial y} \right) \right\} d\Omega$$

$$= \int_{\Gamma_i} N_k^i \left( \left( \frac{\partial \theta^i}{\partial x} + Du \frac{\partial \phi^i}{\partial x} \right) n_x + \left( \frac{\partial \theta^i}{\partial y} + Du \frac{\partial \phi^i}{\partial y} \right) n_y \right) d\Gamma_i \tag{26}$$

$$\int_{e_i} N_k^i \left\{ \frac{\partial N_k^i}{\partial x} \frac{\partial \phi^i}{\partial x} + \frac{\partial N_k^i}{\partial y} \frac{\partial \phi^i}{\partial y} - Sc N_k^i \left( \frac{\partial \psi^i}{\partial y} \frac{\partial \phi^i}{\partial x} - \frac{\partial \psi^i}{\partial x} \frac{\partial \phi^i}{\partial y} \right) - k \phi^i + ScSo \left( \frac{\partial N_k^i}{\partial x} \frac{\partial \theta^i}{\partial x} + \frac{\partial N_k^i}{\partial y} \frac{\partial \theta^i}{\partial y} \right) \right\} d\Omega$$

$$= \int_{\Gamma_i} N_k^i \left( \left( \frac{\partial \theta^i}{\partial x} + ScSo \frac{\partial \phi^i}{\partial x} \right) n_x + \left( \frac{\partial \theta^i}{\partial y} + ScSo \frac{\partial \phi^i}{\partial y} \right) n_y \right) d\Gamma_i \tag{27}$$

where  $\Gamma_i$  is the boundary of  $e_i$ .

Substituting L.H.S. of Eqs. (19) through (21) for  $\psi^i, \theta^i$  and  $\phi^i$  in Eqs. (26) and (27) we get

$$\sum_i \int_{e_i} \left(1 + \frac{4N}{3}\right) \frac{\partial N_k^i}{\partial x} \frac{\partial N_L^i}{\partial x} + \frac{\partial N_k^i}{\partial y} \frac{\partial N_L^i}{\partial y} - \text{Pr} \sum_m \psi_m^i \int_{e_i} \left( \frac{\partial N_m^i}{\partial y} \frac{\partial N_L^i}{\partial x} - \frac{\partial N_m^i}{\partial x} \frac{\partial N_L^i}{\partial y} \right) d\Omega$$

$$- \alpha \sum_i \theta^i \int_{e_i} N_k^i N_L^i d\Omega + Du \sum_i \int_{e_i} \left( \frac{\partial N_k^i}{\partial x} \frac{\partial N_L^i}{\partial x} + \frac{\partial N_k^i}{\partial y} \frac{\partial N_L^i}{\partial y} \right) d\Omega$$

$$= \int_{\Gamma_i} N_k^i \left( \frac{\partial \theta^i}{\partial x} + Du \frac{\partial \phi^i}{\partial x} \right) n_x + \left( \frac{\partial \theta^i}{\partial y} + Du \frac{\partial \phi^i}{\partial y} \right) n_y \right) d\Gamma_i = Q_k^i (l, m, k = 1, 2, 3) \quad (28)$$

$$\begin{aligned} & \sum_{ei} \int \phi^i \left( \frac{\partial N_k^i}{\partial x} \frac{\partial N_L^i}{\partial x} + \frac{\partial N_L^i}{\partial y} \frac{\partial N_k^i}{\partial y} \right) - Sc \sum_{ei} \psi_m^i \int \left( \frac{\partial N_m^i}{\partial y} \frac{\partial N_L^i}{\partial x} - \frac{\partial N_m^i}{\partial x} \frac{\partial N_L^i}{\partial y} \right) d\Omega \\ & + ScSo \sum_{ei} \theta^i \int \left( \frac{\partial N_k^i}{\partial x} \frac{\partial N_L^i}{\partial x} + \frac{\partial N_L^i}{\partial y} \frac{\partial N_k^i}{\partial y} \right) d\Omega_i - k \sum_I \phi^i N_k^i N_L^i d\Omega = \\ & \int_{\Gamma_i} N_k^i \left( \frac{\partial \theta^i}{\partial x} + ScSo \frac{\partial \phi^i}{\partial x} \right) n_x + \left( \frac{\partial \theta^i}{\partial y} + ScSo \frac{\partial \phi^i}{\partial y} \right) n_y \right) d\Gamma_i = Q_i^C (l, m, k = 1, 2, 3) \end{aligned} \quad (29)$$

where  $Q_k^i = Q_{k1}^i + Q_{k2}^i + Q_{k3}^i$ ,  $Q_k^i$ 's being the values of  $Q_k^i$  on the sides  $s = (1, 2, 3)$  of the element  $e_i$ . The sign of  $Q_k^i$ 's depends on the direction of the outward normal with respect to the element.

Choosing different  $N_k^i$ 's as weight functions and following the same procedure, we obtain the matrix equations for three unknowns ( $Q_p^i$ ) viz.,

$$(a_p^i)(\theta_p^i) = (Q_k^i) \quad (30)$$

where  $(a_{pk}^i)$  is a  $3 \times 3$  matrix,  $(\theta_p^i), (Q_k^i)$  are column matrices.

Repeating the above process with each of  $s$  elements, we obtain sets of such matrix equations. Introducing the global coordinates and global values for  $\theta_p^i$  and making use of inter-element continuity and boundary conditions relevant to the problem, the above stiffness matrices are assembled to obtain a global matrix equation. This global matrix is  $r \times r$  square matrix if there are  $r$  distinct global nodes in the domain of flow considered. Similarly, substituting  $\psi^i, \theta^i$  and  $\phi^i$  in Eq. (12) and defining the error

$$E_3^i = (1 + M^2) \frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} - Ra \left( \frac{\partial \theta}{\partial x} (1 + 2\gamma\theta) + N \frac{\partial \phi}{\partial x} \right) \quad (31)$$

and following the Galerkin method, we obtain

$$\int_{\Omega} E_3^i \psi_j^i d\Omega = 0 \quad (32)$$

Using Green's theorem, Eq. (28) reduces to

$$\begin{aligned} & \int_{\Omega} \left( (1 + M^2) \frac{\partial N_k^i}{\partial x} \frac{\partial \psi^i}{\partial x} + \frac{\partial N_k^i}{\partial y} \frac{\partial \psi^i}{\partial y} + Ra \left( \theta^i \frac{\partial N_k^i}{\partial x} + 2\gamma\theta^i N_k^i \frac{\partial N_k^i}{\partial x} + \phi^i \frac{\partial N_k^i}{\partial x} \right) \right) d\Omega \\ & = \int_{\Gamma} N_k^i \left( \frac{\partial \psi^i}{\partial x} n_x + \frac{\partial \psi^i}{\partial y} n_y \right) d\Gamma_i + \int_{\Gamma} N_k^i n_x \theta^i d\Gamma_i \end{aligned} \quad (33)$$

In obtaining Eq. (33), the Green's theorem is applied with respect to derivatives of  $\psi$  without affecting the  $\theta$  terms. Using Eqs. (19, 20, 21) and (22) in (33), we have

$$\sum_m \psi_m^i \left\{ \int_{\Omega} \left( (1 + M^2) \frac{\partial N_k^i}{\partial x} \frac{\partial N_m^i}{\partial x} + \frac{\partial N_m^i}{\partial y} \frac{\partial N_k^i}{\partial y} \right) d\Omega + Ra \sum_L (\theta_L^i \int_{\Omega} N_k^i \frac{\partial N_L^i}{\partial x} (1 + 2\gamma N_{ki}^i) d\Omega + \phi_L^i N \int_{\Omega} N_k^i \frac{\partial N_L^i}{\partial x} d\Omega) \right\}$$

$$= \int_{\Gamma} N_k^i \left( \frac{\partial \psi^i}{\partial x} n_x + \frac{\partial \psi^i}{\partial y} n_y \right) d\Gamma_i + \int_{\Gamma} N_k^i \theta^i d\Omega_i = \Gamma_k^i \tag{34}$$

In the problem under consideration, for computational purpose, we choose uniform mesh of 10 triangular elements (Fig. II). The domain has vertices whose global coordinates are (0,0), (1,0) and (1,h) in the non-dimensional form. Let  $e_1, e_2, \dots, e_{10}$  be the ten elements and let  $\theta_1, \theta_2, \dots, \theta_{10}$  be the global values of  $\theta$  and  $\psi_1, \psi_2, \dots, \psi_{10}$  be the global values of  $\psi$  at the global nodes of the domain (Fig. II).

Fig. 2. Schematic Diagram of the Configuration

**Shape Functions and Stiffness Matrices:**

Range functions in  $n_{i,j}$ ;  $i$  = element,  $j$  = node.

$$n_{1,1} = 1 - 3x, \quad n_{1,2} = 3x - \frac{3y}{h}, \quad n_{2,1} = 1 - \frac{3y}{h}, \quad n_{2,2} = -1 + \frac{3y}{h}, \quad n_{2,3} = 1 - 3x + \frac{3y}{h}, \quad n_{3,1} = 2 - 3x, \quad n_{3,2} = -1 + 3x - \frac{3y}{h}, \quad n_{3,3} = \frac{3y}{h}$$

$$n_{4,1} = 1 - \frac{3y}{h}, \quad n_{4,2} = -2 + 3x, \quad n_{4,3} = 2 - 3x + \frac{3y}{h}, \quad n_{5,1} = 2 - 3x, \quad n_{5,2} = -1 + 3x - \frac{3y}{h}, \quad n_{5,3} = \frac{3y}{h}, \quad n_{6,1} = 2 - 3x,$$

$$n_{6,2} = 3x - \frac{3y}{h}, \quad n_{6,3} = 1 + \frac{3y}{h}, \quad n_{7,1} = 2 - \frac{3y}{h}, \quad n_{7,2} = -2 + 3x, \quad n_{7,3} = 1 - 3x + \frac{3y}{h}, \quad n_{8,1} = 3 - 3x, \quad n_{8,2} = -1 + 3x - \frac{3y}{h},$$

$$n_{9,2} = 3x - \frac{3y}{h}, \quad n_{9,3} = -1 + \frac{3y}{h}$$

Substituting the above shape functions in Eqs. (28), (29) and (34) with respect to each element and integrating over the respective triangular domain we obtain the element in the form Eq. (28). The 3x3 matrix equations are assembled using connectivity conditions to obtain a 8x8 matrix equations for the global nodes  $\psi_p, \theta_p$  and  $\phi_p$ .

The global matrix equation for  $\theta$  is

$$A_3 X_3 = B_3 \tag{35}$$

The global matrix equation for  $\phi$  is

$$A_4 X_4 = B_4 \tag{36}$$

The global matrix equation for  $\psi$  is

$$A_5 X_5 = B_5 \tag{37}$$

where

$$\begin{aligned}
 \mathbf{A}_3 &= \begin{pmatrix} -1 & a_{12} & a_{13} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & a_{22} & a_{23} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & a_{32} & a_{33} & a_{34} & a_{35} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & a_{44} & a_{44} & a_{45} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & a_{53} & a_{54} & a_{55} & a_{56} & a_{57} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & a_{65} & a_{66} & a_{67} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & a_{75} & a_{76} & a_{77} & a_{78} & a_{79} & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & a_{87} & a_{88} & a_{89} & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_{97} & a_{98} & a_{99} & a_{100} & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_{109} & a_{1010} & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_{119} & a_{1110} & -1 & 0 \end{pmatrix} \\

 \end{aligned}$$

The global matrix equations are coupled and are solved under the following iterative procedures. At the beginning of the first iteration, the values of  $(\psi_i)$  are taken to be zero and the global equations (35) and (36) are solved for the nodal values of  $\theta$  and  $\phi$ . These obtained nodal values  $(\theta_i)$  and  $(\phi_i)$  are then used to solve the global equation (37) to obtain  $(\psi_i)$ . In the second iteration, these  $(\psi_i)$  values are obtained and used in Eqs. (35) and (36) to calculate  $(\theta_i)$  and  $(\phi_i)$  and vice versa. The three equations are thus solved under iteration process until two consecutive iterations differ by a pre-assigned percentage.

The domain consists three horizontal levels and the solution for  $\Psi$  &  $\theta$  at each level may be expressed in terms of the nodal values as follows:

In the horizontal strip  $0 \leq y \leq \frac{h}{3}$

$$\Psi = (\Psi_1 N^1_1 + \Psi_2 N^1_2 + \Psi_7 N^1_7) H(1 - \tau_1) = \Psi_1 (1 - 4x) + \Psi_2 4(x - \frac{y}{h}) + \Psi_7 (\frac{4y}{h} (1 - \tau_1)) \quad (0 \leq x \leq \frac{1}{3})$$

$$\Psi = (\Psi_2 N^3_2 + \Psi_3 N^3_3 + \Psi_6 N^3_6) H(1 - \tau_2) + (\Psi_2 N^2_2 + \Psi_7 N^2_7 + \Psi_6 N^2_6) H(1 - \tau_3) \quad (\frac{1}{3} \leq x \leq \frac{2}{3})$$

$$= (\Psi_2 2(1 - 2x) + \Psi_3 (4x - \frac{4y}{h} - 1) + \Psi_6 (\frac{4y}{h})) H(1 - \tau_2) + (\Psi_2 (1 - \frac{4y}{h}) + \Psi_7 (1 + \frac{4y}{h} - 4x) + \Psi_6 (4x - 1)) H(1 - \tau_3)$$

$$\begin{aligned}
 \Psi &= (\Psi_3 N^5_3 + \Psi_4 N^5_4 + \Psi_5 N^5_5) H(1 - \tau_3) + (\Psi_3 N^4_3 + \Psi_5 N^4_5 + \Psi_6 N^4_6) H(1 - \tau_4) \\
 &= (\Psi_3 (3 - 4x) + \Psi_4 2(2x - \frac{2y}{h} - 1) + \Psi_6 (\frac{4y}{h} - 4x + 3)) H(1 - \tau_3) + \Psi_3 (1 - \frac{4y}{h}) + \Psi_5 (4x - 3) + \Psi_6 (\frac{4y}{h}) H(1 - \tau_4) \quad (\frac{2}{3} \leq x \leq 1)
 \end{aligned}$$

Along the strip  $\frac{h}{3} \leq y \leq \frac{2h}{3}$

$$\begin{aligned}
 \Psi &= (\Psi_7 N^6_7 + \Psi_6 N^6_6 + \Psi_8 N^6_8) H(1 - \tau_2) + (\Psi_6 N^7_6 + \Psi_9 N^7_9 + \Psi_8 N^7_8) H(1 - \tau_3) \\
 &+ (\Psi_6 N^8_6 + \Psi_5 N^8_5 + \Psi_9 N^8_9) H(1 - \tau_4) \quad (\frac{1}{3} \leq x \leq 1)
 \end{aligned}$$

$$\Psi = (\Psi_7 2(1 - 2x) + \Psi_6 (4x - 3) + \Psi_8 (\frac{4y}{h} - 1)) H(1 - \tau_2) + \Psi_6 (2(1 - \frac{2y}{h}) + \Psi_9 (\frac{4y}{h} - 1) + \Psi_8 (1 + \frac{4y}{h} - 4x)) H(1 - \tau_4)$$

$$+ \Psi_6 (4(1-x) + \Psi_5 (4x - \frac{4y}{h} - 1) + \Psi_9 2(\frac{2y}{h} - 1)) H(1 - \tau_5)$$

Along the strip  $\frac{2h}{3} \leq y \leq 1$

$$\Psi = (\Psi_8 N_8^9 + \Psi_9 N_9^9 + \Psi_{10} N_{10}^9) H(1 - \tau_6) \quad (\frac{2}{3} \leq x \leq 1)$$

$$= \Psi_8 (4(1-x) + \Psi_9 4(x - \frac{y}{h}) + \Psi_{10} 2(\frac{4y}{h} - 3)) H(1 - \tau_6)$$

where  $\tau_1 = 4x$ ,  $\tau_2 = 2x$ ,  $\tau_3 = \frac{4x}{3}$ ,  $\tau_4 = 4(x - \frac{y}{h})$ ,  $\tau_5 = 2(x - \frac{y}{h})$ ,  $\tau_6 = \frac{4}{3}(x - \frac{y}{h})$  and H represents the right side function.

The expressions for  $\theta$  are as follows:

In the horizontal strip  $0 \leq y \leq \frac{h}{3}$

$$\theta = [\theta_1(1-4x) + \theta_2 4(x - \frac{y}{h}) + \theta_7 (\frac{4y}{h})] H(1 - \tau_1) \quad (0 \leq x \leq \frac{1}{3})$$

$$\theta = (\theta_2(2(1-2x) + \theta_3 (4x - \frac{4y}{h} - 1) + \theta_6 (\frac{4y}{h})) H(1 - \tau_2) + \theta_2(1 - \frac{4y}{h}) + \theta_7(1 + \frac{4y}{h} - 4x) + \theta_6(4x - 1)) H(1 - \tau_3)$$

$$(\frac{1}{3} \leq x \leq \frac{2}{3})$$

$$\theta = \theta_3(3-4x) + 2\theta_4(2x - \frac{2y}{h} - 1) + \theta_6(\frac{4y}{h} - 4x + 3) H(1 - \tau_3) + (\theta_3(1 - \frac{4y}{h}) + \theta_5(4x - 3) + \theta_6(\frac{4y}{h})) H(1 - \tau_4)$$

$$(\frac{2}{3} \leq x \leq 1)$$

Along the strip  $\frac{h}{3} \leq y \leq \frac{2h}{3}$

$$\theta = (\theta_7(2(1-2x) + \theta_6(4x - 3) + \theta_8(\frac{4y}{h} - 1)) H(1 - \tau_3) + (\theta_6(2(1 - \frac{2y}{h}) + \theta_9(\frac{4y}{h} - 1) + \theta_8(1 + \frac{4y}{h} - 4x)) H(1 - \tau_4)$$

$$+ (\theta_6(4(1-x) + \theta_5(4x - \frac{4y}{h} - 1) + \theta_9 2(\frac{4y}{h} - 1)) H(1 - \tau_5) \quad (\frac{1}{3} \leq x \leq \frac{2}{3})$$

Along the strip  $\frac{2h}{3} \leq y \leq 1$

$$\theta = (\theta_8 4(1-x) + \theta_9 4(x - \frac{y}{h}) + \theta_{10}(\frac{4y}{h} - 3)) H(1 - \tau_6) \quad (\frac{2}{3} \leq x \leq 1)$$

The expressions for  $\phi$  are

$$\phi = [\phi_1(1-4x) + \phi_2 4(x - \frac{y}{h}) + \phi_7 (\frac{4y}{h})] H(1 - \tau_1) \quad (0 \leq x \leq \frac{1}{3})$$

$$\phi = (\phi_2(2(1-2x) + \phi_3 (4x - \frac{4y}{h} - 1) + \phi_6 (\frac{4y}{h})) H(1 - \tau_2)$$

$$+ \phi_2(1 - \frac{4y}{h}) + \phi_7(1 + \frac{4y}{h} - 4x) + \phi_6(4x - 1)) H(1 - \tau_3) \quad (\frac{1}{3} \leq x \leq \frac{2}{3})$$

$$\phi = \phi_3(3-4x) + 2\phi_4(2x - \frac{2y}{h} - 1) + \phi_6(\frac{4y}{h} - 4x + 3) H(1 - \tau_3) + (\phi_3(1 - \frac{4y}{h}) + \phi_5(4x - 3) + \phi_6(\frac{4y}{h})) H(1 - \tau_4) \quad (\frac{2}{3} \leq x \leq 1)$$

Along the strip  $\frac{h}{3} \leq y \leq \frac{2h}{3}$

$$\phi = (\phi_7(2(1-2x) + \phi_6(4x-3) + \phi_8(\frac{4y}{h}-1)) H(1-\tau_3) + (\phi_6(2(1-\frac{2y}{h}) + \phi_9(\frac{4y}{h}-1) + \phi_8(1+\frac{4y}{h}-4x)) H(1-\tau_4) \\ + (\phi_6(4(1-x) + \phi_5(4x-\frac{4y}{h}-1) + \phi_9 2(\frac{4y}{h}-1)) H(1-\tau_5) \quad (\frac{1}{3} \leq x \leq \frac{2}{3})$$

Along the strip  $\frac{2h}{3} \leq y \leq 1$

$$\phi = (\phi_8 4(1-x) + \phi_9 4(x-\frac{y}{h}) + \phi_{10}(\frac{4y}{h}-3) H(1-\tau_6) \quad (\frac{2}{3} \leq x \leq 1)$$

The dimensionless Nusselt number (Nu) and the Sherwood number (Sh) on the non-insulated boundary walls of the rectangular duct are calculated using the formulas:

$$Nu = \left(\frac{\partial \theta}{\partial x}\right)_{x=1} \text{ and } Sh = \left(\frac{\partial \phi}{\partial x}\right)_{x=1}.$$

The Nusselt number on the side wall  $x=1$  in different regions are given by

$$Nu_1 = \binom{n}{5,1}_x \theta_3 + \binom{n}{5,2}_x \theta_4 + \binom{n}{5,3}_x \theta_5, Sh_1 = \binom{n}{5,1}_x \phi_3 + \binom{n}{5,2}_x \phi_4 + \binom{n}{5,3}_x \phi_5, \quad (0 \leq y \leq h/3)$$

$$Nu_2 = \binom{n}{6,1}_x \theta_6 + \binom{n}{6,2}_x \theta_5 + \binom{n}{6,3}_x \theta_9, Sh_2 = \binom{n}{6,1}_x \phi_6 + \binom{n}{6,2}_x \phi_5 + \binom{n}{6,3}_x \phi_9 \quad ($$

$$h/3 \leq y \leq 2h/3)$$

$$Nu_3 = \binom{n}{9,1}_x \theta_8 + \binom{n}{9,2}_x \theta_9 + \binom{n}{9,3}_x \theta_{10}, Sh_3 = \binom{n}{9,1}_x \phi_8 + \binom{n}{9,2}_x \phi_9 + \binom{n}{9,3}_x \phi_{10} \quad (2h/3 \leq y \leq h)$$

The suffix 'x' denotes differentiation of the shape functions with respect to 'x'. Substituting the shape functions and the boundary conditions, the Nusselt number and the Sherwood number in different regions are

$$Nu_1=2-4\theta_3 \quad (0 \leq y \leq h/3), Nu_2=2-4\theta_5 \quad (h/3 \leq y \leq 2h/3), Nu_3=2-4\theta_7 \quad (2h/3 \leq y \leq h)$$

The Sherwood number on the side wall  $x=1$  in different regions are:

$$Sh_1=2-4\phi_3 \quad (0 \leq y \leq h/3), Sh_2=2-4\phi_5 \quad (h/3 \leq y \leq 2h/3), Sh_3=2-4\phi_7 \quad (2h/3 \leq y \leq h)$$

### Comparison:

In this analysis, it should be mentioned that the results obtained herein are compared with the results of Shanthi et al. [13] as shown in Table A in the absence of  $Du=0, \gamma=0, Q=0$  and the results are found to be in good agreement.

## RESULTS AND DISCUSSION

In this analysis, we investigate the effect of the non-linear density temperature variation in a convective heat and mass transfer of an electrically-conducting viscous fluid through a porous medium in a rectangular duct with Soret and Dufour effects. The equations governing the flow and heat and mass transfer have been solved by employing the Galerkin finite-element analysis with tri-nodal triangular elements. The non-dimensional temperature ( $\theta$ ) is shown in Figs. 3-22 for different values of  $M, Q, Rad, So, Du$  and  $\gamma$  at different horizontal and vertical levels. The temperature

( $\theta$ ) and concentration ( $\phi$ ) are plotted versus different levels of  $x$  and  $y$  for the values  $M=5, N=1, \alpha=2, k=0.5, Q=0.5, \text{Rad}=0.05, \text{Sr}=2, \text{Du}=0.3, \text{Pr}=0.71, N=0.5, \gamma=0.01, \text{Ra}=0.5$  and specific variations of physical parametric values varies unless remain same. We follow the convention that the non-dimensional temperature  $\theta$  is positive or negative according to whether the actual temperate ( $T$ ) is greater or less than the temperature ( $T_c$ ) on the cold wall  $x=1$ .

**2.1. Temperature Profiles**

Figs. 3-6 present  $\theta$  with the Hartmann number  $M$ . We find that the higher the Lorentz force the larger the actual temperature at  $y=h/3$  and the vertical levels  $x=1/3$  and  $2/3$  and reduces at the higher horizontal level  $y=2h/3$ . This is due to the fact that the strength of flow decreases and thereby the temperature enhances in the boundary layer. Figs. 7-10 present  $\theta$  with the radiation absorption parameter  $Q$ . It is observed that an increase in  $Q$ , enhances the actual temperature at  $y=h/3$ , and  $x=1/3$  and  $2/3$  levels and reduces at  $y=2h/3$  level. As the Rosseland radiative absorption parameter  $Q$  diminishes, the subsequent heat flux varies and thus reduces the rate of radiative heat transfer to the fluid which causes the rise in temperature. Figs. 11-14 display  $\theta$  with the radiation parameter  $\text{Rad}$ . It is found that the higher the thermal radiation the smaller the actual temperature at both the vertical levels and at  $y=2h/3$  level and larger at  $y=h/3$  level. This may be due to the thermal radiation increases gradually in the fluid flow, causes an enhancement in the temperature in the boundary layer of the fluid flow. Figs. 15-18 show  $\theta$  with the Soret parameter  $So$  or the Dufour parameter  $\text{Du}$ . By increasing the value of  $So$  (or decreasing  $\text{Du}$ ), we notice an enhancement in the actual temperature at  $y=2h/3$  level, and depreciation at  $y=h/3, x=1/3$  and  $2/3$  levels. This is attributed to the fact that an enhancement of Soret parameter  $So$  (or decrease in Dufour parameter  $\text{Daf}$ ) results an increase in the thickness of the boundary layer at the upper levels and reduces at lower levels of the fluid. The effect of the non-linear density temperature relation on  $\theta$  is executed in Figs. 19-22. It is found that the actual temperature enhances at  $y=h/3, x=1/3$  and  $2/3$  levels, while at  $y=2h/3$  level, the actual temperature reduces with  $\gamma \leq 0.5$  and enhances with  $\gamma \geq 0.7$ . This is due to fact that the thickness of the boundary layer flow reduces and results the enhancement in the temperature at horizontal levels of the boundary layer and reduces the temperature for vertical levels of the boundary layer flow.

**2.2. Concentration Profiles**

The concentration distribution (C) is shown in Figs. 23-42 for different parametric values at different horizontal and vertical levels. We follow the convention that the concentration is positive or negative according to whether the actual concentration is greater or less than  $C_c$ , the concentration on the cold wall. Figs. 23-26 present C with M. It is found that the Lorentz force reduces the actual concentration and for further lowering of the force smaller the actual concentration at the levels  $y=h/3, 2h/3, x=1/3, 2/3$ . This is due to the fact that the strength of flow decreases and thereby the concentration reduces in the flow region. Figs. 27-30 show C with Q. An increase in the radiation absorption parameter Q, reduces the actual concentration at  $y=2h/3$  level and enhances it at  $y=h/3$  and  $x=1/3$  levels. At  $x=2/3$  level, the actual concentration enhances in the region (0.066, 0.33) and reduces in the flow region (0.396, 0.666). As the radiation absorption increases in the entire flow region the actual concentration increase in the boundary layer fluid and decrease at the horizontal levels. Figs. 31-34 show the variation of C with the thermal radiation parameter Rad. It is found that the actual concentration reduces with Rad at  $y=2h/3$  and  $x=1/3$  and  $2/3$  levels and enhances at  $y=h/3$  level. This may be due to the thermal radiation increases gradually in the fluid flow, causes depreciation in the concentration in the higher levels and enhances in the lower levels of the fluid flow. Figs. 35-38 display C with  $So$  and  $Daf$ . It can be seen from the profiles that increasing  $So$  (or decreasing  $Daf$ ) results in an enhancement in the actual concentration at  $y=2h/3$  and depreciation at  $y=h/3$  and  $x=1/3$  levels (Figs. 36-37). This is due to the fact that an enhancement of Soret parameter  $So$  (or decrease in Dufour parameter  $Daf$ ) results in an increase in the thickness of the boundary layer at the upper levels and reduces at lower level of the fluid. At  $x=2/3$  level, the actual concentration reduces in the horizontal strip ( $0 \leq y \leq 0.264$ ) and enhances in the region ( $0.33 \leq y \leq 0.666$ ) for  $So \leq 1.5$  and for  $So \geq 2$ , we found a depreciation in the actual concentration in the entire region as shown in Fig. 38. Figs. 39-42 show the variation of C with the density ratio  $\gamma$ . The thickness of the boundary layer flow reduces due to the enhancement of concentration in the entire flow region. It can be seen from the profiles that the non-linearity in the density-temperature relation results in depreciation in the actual concentration at all levels.

The rate of heat transfer, Nusselt number (Nu) and the rate of mass transfer, Sherwood number (Sh), on the side  $x=1$  are shown in Tables 1-5 for different values of M, Q, Rad, So, Du and  $\gamma$ . With respect to the Hartmann number M, we find that the higher the molecular diffusivity, the smaller  $|Nu|$  on the lower quadrant and larger on the middle and upper quadrants and for further higher Lorentz force the larger  $|Nu|$  on the lower quadrant and smaller on the middle and upper quadrant. An increase in M, enhances  $|Sh|$  on the lower and middle quadrants and reduces it on the upper quadrant.  $|Sh|$  experiences depreciation with an increase in Q on all the three quadrants as shown in Table 1.

Table 1: Effect of M on Nusselt and Sherwood numbers for  $Q=0.5, Rad=0.05, So=2, Du=0.3, \gamma=0.01, X=1$

Parameter M	Nu1	Nu2	Nu3	Sh1	Sh2	Sh3
5	2.5720	2.2538	1.9356	6.84148	1.57600	-3.68944
10	1.6655	2.6081	3.5617	8.35244	2.03041	-4.2916
15	1.8391	2.2948	2.7505	8.49364	2.11208	-4.26948

An increase in the radiation absorption parameter  $Q$ , reduces  $|\text{Nu}|$  on the lower and middle quadrants and enhances it on the upper quadrant.  $|\text{Sh}|$  experiences depreciation with an increase in  $Q$  on all the three quadrants as shown in Table 2.

**Table 2: Effect of  $Q$  on Nusselt and Sherwood numbers for  $M=0.5$ ,  $\text{Rad}=0.05$ ,  $\text{So}=2$ ,  $\text{Du}=0.3$ ,  $\gamma=0.01$ ,  $X=1$**

Parameter $Q$	Nu1	Nu2	Nu3	Sh1	Sh2	Sh3
0.5	1.8391	2.2948	2.7505	8.4937	2.1121	-4.2695
1.5	2.5030	2.2269	1.9509	7.9952	1.8123	-4.3699
2.5	2.4288	2.1947	1.9607	7.981	1.8113	-4.3584

The variation of  $\text{Nu}$  with Radiation parameter  $\text{Rad}$  shows that the Nusselt number enhances on the lower quadrant and reduces on the upper quadrant with an increase in  $\text{Rad}$ , while on the middle quadrant, the Nusselt number reduces for the condition  $\text{Rad} \leq 0.5$  and enhances for  $\text{Rad} \geq 1.5$ . With respect to the radiation parameter  $\text{Rad}$ , we find that the rate of mass transfer on the lower and middle quadrants reduces for  $\text{Rad} \leq 0.5$  and enhances for  $\text{Rad} \geq 2.5$  while in the upper quadrant it reduces with  $\text{Rad}$ . The variation of  $\text{Sh}$  with the buoyancy ratio of  $N$  shows that  $|\text{Sh}|$  reduces on all the three quadrants with an increase in  $N \geq 0$  while the buoyancy forces are in the same direction and for the forces acting in the opposite direction the Sherwood number on the lower and middle quadrants enhances with  $|\text{Rad}|$  and reduces on the upper quadrant as shown in Table 3.

**Table 3: Effect of  $\text{Rad}$  on Nusselt and Sherwood numbers for  $M=0.5$ ,  $Q=0.5$ ,  $\text{So}=2$ ,  $\text{Du}=0.3$ ,  $\gamma=0.01$ ,  $X=1$**

Parameter $\text{Rad}$	Nu1	Nu2	Nu3	Sh1	Sh2	Sh3
0.05	-1.510	7.506	16.522	6.3046	0.3478	-5.609
0.15	7.893	1.749	-4.393	7.8725	1.7499	-4.394
0.25	7.931	0.365	-4.387	7.9311	1.7717	-4.388
0.5	8.009	0.574	-4.381	8.0092	2.5848	-4.382

The variation of  $\text{Nu}$  with the Soret and Dufour parameters ( $\text{So}$  and  $\text{Du}$ ) are shown in Table 4. An increase in the Soret parameter  $\text{So} \leq 1.5$  (or a decrease in the Dufour parameter  $\text{Du}$ ) enhances  $|\text{Nu}|$  and reduces for  $\text{So} \geq 2.0$  on all the three quadrants. With respect to the Soret and Dufour parameters ( $\text{So}$  and  $\text{Du}$ ), we find that increasing  $\text{So}$  ( $\text{So} \geq 1.5$ ) (or decreasing  $\text{Du}$ ) enhances  $\text{Sh}$  on the lower quadrant, and reduces in the upper quadrant and for  $\text{So} \geq 2$ , we notice a depreciation in  $|\text{Sh}|$  on the lower quadrant and an enhancement on the upper quadrant.  $|\text{Sh}|$  reduces with  $\text{So}$  in the lower and middle quadrants.

**Table 4: Effect of  $\text{So}$ ,  $\text{Du}$  on Nusselt and Sherwood numbers for  $M=0.5$ ,  $Q=0.5$ ,  $\text{Rad}=0.05$ ,  $\gamma=0.01$ ,  $X=1$**

Parameter $\text{So}, \text{Du}$	Nu1	Nu2	Nu3	Sh1	Sh2	Sh3

## CONCLUSION

The problem of mixed convective flow of a viscous electrically-conducting fluid through a porous medium in a rectangular duct in the presence of Soret and Dufour effects was investigated. The equations were solved numerically using the Galerkin finite-element analysis with tri-nodal triangular elements for the computation of the flow, heat and mass transfer characteristics for various values of the Hartmann number, strength of heat source, radiation parameter, Soret number, Dufour number and the density ratio. We considered the heat flux on the base and the top walls to be constant. We assumed that the convective fluid and the porous medium were everywhere in local thermal equilibrium and that there was no phase change of the fluid in the medium. The properties of the fluid

and the porous medium were assumed homogeneous and isotropic, and the porous medium was assumed to be closely packed so that the Darcy's momentum law was adequate in the porous medium. The numerical results were obtained and compared with previously reported cases available in the open literature and they were found to be in good agreement. Graphical results for various parametric conditions were presented and discussed for different values. The main findings are summarized as follows:

- The presence of the Magnetic field  $M$  caused a significant effect on the heat and mass transfer rates.
- An increase in Radiation absorption parameter  $Q$  the actual temperature and actual concentration enhances at vertical level. However, the actual temperature and actual concentration decreases at horizontal levels.
- At higher values of Thermal radiation parameter  $Rad$ , smaller the actual temperature at both vertical levels and at  $y=2h/3$  and larger at  $y=h/3$ . Furthermore, the actual temperature and actual concentration decreases at the horizontal levels.
- An increase in Soret parameter  $So$  (or decrease in Dufour parameter  $Du$ ) increases the actual temperature and actual concentration at vertical levels. An increase in Soret parameter  $So$  (or decrease in Dufour parameter  $Du$ ) reduces the actual temperature and actual concentration at horizontal levels.
- Presence of Non-linear-Density-temperature relation ( $\Upsilon$ ) influences the actual temperature at both vertical and horizontal levels. While the Non-linear-Density-Temperature relation results depreciation in the actual concentration at all levels.
