

The Integration of Digital Technology in Periodontics: Enhancing Precision and Patient Care

Sarah M. Hughes*

Department of Periodontics, King's College London, United Kingdom

DESCRIPTION

The advent of digital technology has revolutionized many aspects of dentistry, with periodontics being no exception. Over the past decade, the integration of digital tools has transformed the way periodontists diagnose, plan, and treat periodontal diseases. These technologies have not only enhanced the precision of clinical procedures but also improved patient outcomes and satisfaction. This article explores the various digital innovations in periodontics, their impact on clinical practice, and the future directions of this rapidly evolving field. One of the most significant advancements in periodontics is the use of digital imaging and diagnostics. Cone-beam computed tomography (CBCT) has become an invaluable tool for periodontists, providing detailed 3D images of the oral structures. This technology allows for more accurate assessment of bone density, the extent of periodontal disease, and the precise location of anatomical landmarks. The ability to visualize the periodontal and bone structures in three dimensions enables periodontists to plan surgeries with greater accuracy, reducing the risk of complications and improving the overall success of treatments. In addition to CBCT, digital intraoral scanners have replaced traditional impression-taking methods in many periodontal practices. These scanners capture high-resolution images of the teeth and gums, creating detailed digital models that can be used for treatment planning and the fabrication of custom surgical guides. The use of digital impressions eliminates the discomfort associated with traditional impression materials and provides a more accurate representation of the oral cavity. This precision is particularly important in procedures such as guided implant surgery, where exact implant placement is critical for long-term success. Digital technology has also revolutionized the planning and execution of periodontal surgeries. Computer-aided design and computer-aided manufacturing (CAD/CAM) systems are now commonly used to create custom surgical guides, which are employed to ensure accurate inci-

sions and implant placements. These guides are based on the digital models generated from CBCT scans and intraoral scans, allowing for a high degree of precision in surgical procedures. The use of CAD/CAM technology has reduced the variability in surgical outcomes and minimized the risk of errors, leading to more predictable results and faster recovery times for patients. Laser technology is another digital innovation that has made significant strides in periodontics. Lasers are now used for a variety of periodontal procedures, including scaling and root planning, gingival contouring, and soft tissue management. The precision of laser technology allows for targeted treatment of diseased tissue while minimizing damage to healthy surrounding structures. Lasers also promote faster healing and reduce postoperative discomfort, making them an attractive option for both patients and clinicians. The use of lasers in periodontics has expanded the range of minimally invasive treatment options available to patients, contributing to improved patient experiences and outcomes. The integration of digital technology in periodontics has also enhanced patient communication and education. Digital tools such as 3D imaging and virtual simulations allow periodontists to visually demonstrate treatment plans to patients, helping them to better understand the procedures and their potential outcomes. This improved communication fosters a more collaborative approach to treatment, where patients are more informed and engaged in their care. Additionally, digital records and imaging can be easily shared with other dental specialists, facilitating multidisciplinary care and ensuring that patients receive comprehensive treatment.

ACKNOWLEDGEMENT

None.

CONFLICT OF INTEREST

The author's declared that they have no conflict of interest.
