

Weed and Other Substance Abuse: Suggestions and Guidelines

Syauqi Rafif*

Department of Pharmacology and Clinical Pharmacy, Padjadjaran University, Indonesia

INTRODUCTION

Improper handling of controlled substances, including weed and other drugs, can lead to severe poisoning and even death. Therefore, a thorough autopsy is essential to understand the underlying cause of these deaths. This account investigation examines the quality of commonly mishandled controlled substances, the techniques used in post-mortem examinations, the measurement of lethality, the system of poisoning, the effects of Side effects and available instructions.

DESCRIPTION

The focus is on seven common groups of controlled substances, namely weed, heroin, amphetamines, cocaine, new psychostimulants and heroin. These gatherings were linked to a series of excessive killings. Most substances in these groups have neurotoxic effects by targeting the focal sensory system "CNS". Therefore, strict guidelines are fundamental to minimize the potential harm caused by these substances. In case of misuse, prescribers must follow the rules to ensure that the medicine they recommend complies with the illustrated instructions. With a better understanding of controlled substance abuse and its consequences, more convincing approaches can be created to reduce its prevalence and associated mortality.

Drug and substance abuse refers to the use of substances for illegal purposes or against clinical advice. This has unfortunate health consequences and can appear as drug addiction or one of many other dangerous or damaging behaviours. This behaviour can lead to drug addiction and various psychological and social health problems. The consequences of drug addiction can be extremely serious, including collisions, drunk driving, aggressive behaviour at home, lewd behaviour, contempt and abuse of youth, and attempted self-harm body and death,

stroke and exceeding the limit.

As the United Nations Global Report on Drugs and Misconduct (UNODC) 2022 points out, some 284 million people used drugs in the previous year, the majority of whom were men between 15 and 64 years old. Seven groups of drugs are considered the most harmful, including weed, heroin, amphetamines, cocaine, new psychostimulants and hallucinogens. Of these, cannabis remains the most consumed drug in the world, with 209 million users expected by 2020. Other substances followed, with heroin having 61 million customers last year, amphetamine with 34 million, cocaine with 21 million and rapture with 20 million customers assessed in 2020.

Improper handling of cannabis and other controlled substances can lead to death from high toxicity and severe intoxication, implying the need for a post-mortem examination to determine the cause of death, investigation of the components of fatal intoxication and find measurements of these substances in their natural state. For example. Guidelines on weeds and other substances are governed by the World Health Association's (WHO) Psychotropic and Opioid Control Rules of 1984, which set out global rules for their control.

CONCLUSION

This account investigation aims to research the ramifications and rules surrounding the abuse of weed and other substances. He will present case reports on substance abuse, discussing the properties of these substances, post-mortem examination methods, lethality measurements, components of intoxication causing mortality and related incidental effects. By providing a comprehensive understanding of the practice and guidance related to cannabis and other substance abuse, this survey aims to contribute important knowledge to the public health sector.
