COSTS FOR AGED CARE IN SWEDEN 2025 - AN EXPLORATION OF DIFFERENT SCENARIOS

M Lagergren

Stockholm Gerontology Research Center, Sweden

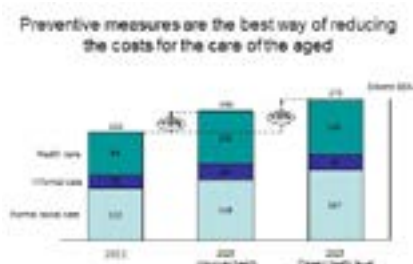

Statement of the Problem: The number of very old in Sweden as in all developed countries will increase rapidly in the coming decades. As a consequence, costs for aged care are expected to increase. Limited manpower and financial resources require that cost-effective solutions are found including means to reduce the needs by health promotion and disease prevention.

Methodology & Theoretical Orientation: Cost for aged care - social care, formal care and health care - in the year 2025 are calculated using different assumptions concerning the health development of older persons in Sweden and the mixture of old age care services provided - home help, sheltered housing and institutional care. Data for calculations are taken from the Swedish National study on Aging and Care (SNAC).

Findings: Assuming continued positive health trends among the older persons as compared with present status makes a big difference in future costs of care. Different scenarios concerning the amount of institutional care vs. home help mainly impact on the cost distribution between aged social care and health care.

Conclusion & Significance: The findings strongly support the emphasis on health promotion and increasing the possibilities for older persons to manage their activities of daily living. A strong case is also made for improving the co-operation between social and health care and to support informal care.
